The Mini Feeds Directory
Welcome to the Mini Feeds Directory which has been compiled to give you an introduction to the key feeds used on farms.

With rising feed costs farmers are looking more to alternative feeds for including in rations for beef cattle and sheep. This booklet will become a useful reference and provides information on the feed value of a range of alternative and more traditional feedstuffs. It also includes a section on the typical feed values of forage crops used on Welsh farms.

The information in this booklet was compiled with the assistance of - Wesley Ewing, Context Donald Brown, Keenan Rumans Lizz Clarke, LC Nutrition Mary Vickers, MLC
This guide covers a range of feeds that are suitable for inclusion in beef and sheep rations. It is not a comprehensive list of all feeds available, but provides a summary of the more common ones.

Feed is a vitally important input to livestock production systems. Not only does it make up the majority of variable costs but it contributes to determining how well animals perform and the profitability of the system. Choosing the right feed will depend on the nutritional requirements of the cattle and sheep concerned, other ingredients in the diet, the facilities available on farm and feed price. Getting a better return from feed relies on providing a well-balanced ration that meets the nutritional needs of the cattle. It is dependent on making the right choices about feed purchasing, storage and targeted rationing.

This guide will help farmers to make decisions about the most appropriate feed for different systems, highlighting some of the issues that need to be considered. It includes useful, practical information about storage requirements, palatability, inclusion rates and nutrient composition of feeds suitable for inclusion in beef and sheep rations.
Getting the Most Out of Alternative Feeds

As well as the traditional feeds included in beef and sheep rations there is an increasing range of ‘alternative feeds’ available and worth considering. The term ‘alternative feeds’ encompasses a huge range of different dry, moist and liquid feeds and blends that tend to be derived from human food and drink manufacturing processes and possibly biofuel production in the future. These feeds can offer farmers the opportunity to purchase cost effective feed products for their cattle that will enable high levels of performance to be achieved when included as part of a properly balanced ration. However it is important that a number of factors are taken into consideration:

Part of a Balanced Ration:
Alternative feeds rarely provide a complete feeding solution for beef/sheep and therefore often rely on good quality home grown feeds to provide a well-balanced ration. Alternative feeds can vary in terms of physical form and nutritional analysis depending upon their source. It is advisable to seek the advice of a professional nutritionist when feeding these products.

Dry, Moist or Liquid Feeds:
Alternative feeds are generally categorised by their physical form – dry, moist or liquid. Dry feeds tend to be in either a pellet or meal form with specific handling and storage characteristics depending on their origin. Moist and liquid feeds, as their name suggests, have a lower dry matter content, which means that good storage facilities are required to minimise waste. Blended feeds are also available which incorporate a range of different alternative feeds into a pellet or meal blend (always ask for the list of ingredients and composition to be sure you know what you are getting).

Storage and Minimising Waste:
Dry feeds have the most flexible storage options with bins, hoppers, on-floor, and in a trailer, all being suitable.

For longer-term storage of moist feeds, ensiling is required. Clean side and top sheets are recommended, held down by material such as bales that ensure all the sheet is in contact with the feed. Moist feed can be capped with potato slurry or citrus wet press, which will also ward off some vermin. Alternatively, moist feeds may be clamped with forages or mixed with dry feeds for storage as a complete feed e.g. grain-beet is a mixture of brewers grains and molassed sugar beet feed. All liquid feeds require storage in either tanks or drums.

Cost Effectiveness:
Regardless of feed type, price will be reduced by being able to order and handle large loads. There may also be opportunities to make savings through forward buying, based on a judgement made about price fluctuations throughout the year.

Farm Assurance:
Most farm assurance schemes stipulate that animals sold as farm assured must have been fed purchased feeds supplied by certified feed companies. Check the details of your own assurance scheme for specific details of feed source assurance specifications.
Formulating Beef Finishing Diets
Finishing diets should be high in energy and also contain the right balance of protein to ensure efficient feed utilisation. Starch tends to be the most common source of energy in intensive diets but a source of sugar is helpful to utilise the starch effectively. The majority of the fibre in cattle diets is provided by forage, and is important for optimizing rumen function. In all diets, ensure the cattle are fed a balanced ration tailored to the breed type, sex and stage of production.

Diets for Sheep
Care should be taken with the selection of feeds for sheep. They should be free from mould/not rotting especially moist feeds or forages where Listeria could grow. Listeria can affect sheep of all ages, but it tends to effect young lambs, causing neurological problems, and pregnant ewes, which may abort as a result of infection. The correct particle/chop size is important to avoid choking and when using distillery or brewery feeds always check the copper level is not too high especially from older facilities using copper equipment.

Using the Information in this Guide
Information is presented about nutritional and utilisation characteristics of common feeds used in the beef and sheep industries but these are by no means the only feeds that can or should be fed.

Category:
Breaks the feeds down into groups. Ideally the ration would contain feeds from a couple of different categories, although this is not essential, and would depend on the basal forage.

Nutritional Notes:
Provides key nutritional information about the feed, highlighting any potential problems.

Palatability:
Indicates how readily cattle will eat the feed.

Upper Inclusion Rate:
A suggested upper limit for inclusion of the feed in a ration on a dry matter basis. Exceeding this limit may cause rumen upset and potential acidosis problems.

Storage/Processing:
An indication of whether a feed needs further processing before feeding. This will effect the overall feed cost, and also storage requirements if processing is carried out on-farm.

Bulk Density:
A guide to how much space will be required for storage per tonne of fresh-weight.

Typical Analysis:
A summary of the average key nutrient composition of feeds. This should be used as a guide only to inform decision-making. A declaration of feed analysis should be sought at purchase to ensure correct diet formulation.
### Barley

**Cereal Grain**

**Appearance**

High in energy, high in starch, low in fibre, low in protein. Should be fed little and often to avoid acidosis, particularly when processed into small particles. When moist, supplementation with vitamin E and selenium is essential.

**Palatability**

Good

**Upper Inclusion Rate (DM)**

50%

**Storage/Processing**

Range of options: dry, moist, wet, whole, ground, rolled and crimped. Dry matter may be less if not dried. Normally they are fed whole to sheep.

**Typical Analysis (% DM or MJ/kg DM for ME)**

**Storage and Feeding of Roots**
Where farm grown roots are a permanent feature, a suitable insulated, air cooled, humidity controlled store could be constructed to avoid losses. Otherwise roots need to be purchased fresh as required, particularly if they are pre-washed as that will reduce their keeping quality. Washed carrots can go off in a week in mild temperatures. Fodder beet, sugar beet, swedes and parsnips can be stored for several months outdoors in straw bale clamps with moderate losses, but are better in cool, dry, aerobic conditions, for example under a roof in an airy building, not sheeted.

If potatoes are to be kept long term, they are best kept unwashed in cool, dark conditions such as outdoor clamps covered with straw and soil.

In anaerobic conditions, washed roots can be mixed with clamped silage or brewers grains, (minimum 2 parts brewers grains to 1 part roots). Washed and chopped roots can be clamped with absorbents such as sugar beet pulp and malt pellets, (4 parts washed and chopped roots to 1 part absorbent).
### Potatoes

**Vegetable**

**Appearance**

![Potatoes Image]

**Nutritional Notes**

High in energy, high in starch, low in fibre, low in protein.

Soil contamination can be a problem and sprouted, green or rotten potatoes should not be fed. It takes 4.25 kg of potatoes to replace 1 kg of barley.

**Palatability**

Upper Inclusion Rate (DM)

Very Good 40%

**Storage/Processing**

Whole or chopped (chopping can reduce risk of choking).

**Typical Analysis (% DM or Mj/kg DM for ME)**

Pulses

Home Grown Protein Options
High protein feeds generally make up a small proportion of beef rations but can still represent a major cost. Home grown options include wholecrop silage or combined beans, peas and lupins. Pulses can be expensive to dry, so crimping has become an attractive option.

Blue lupins are slightly lower in protein than other types; for combining they are better suited to the north and west where harvest is late. White lupins are best suited for combining in the south and used for silage making mixed with other crops such as triticale. Yellow lupins suit slightly later areas for combining.

Field beans come in autumn and early spring sown varieties. The spring sown varieties are generally higher quality but can have a very late harvest particularly in the north and frequently require spraying off before combining. Peas have an earlier harvest but can be difficult to combine.

Different Types of Soya Bean Meal

Soya is generally grown in North and South America, but also other parts of the world. The oil is partially removed by crushing, which is known as the expeller process, with the remaining oil removed by solvent extraction.

There are three types of soya bean meal available for purchase, Hi-pro soya, Brazilian soya and Argentinean soya. Hi-pro soya is generally the better quality soya bean meal, with a crude protein content between 45 - 55%. Argentinean soya contains more fibre, has a lower crude protein level of around 40 - 45% CP, and is slightly lower in energy than the other two. Brazilian soya has a feeding quality between that of Hi-pro and Argentinean. All the types of soya are similar in appearance and available as a meal or in some instances containing some nuts/pellets depending on original source.

**Molasses-based and other Liquid Feeds**

There is a huge range of blended liquid feeds available that are more free flowing than cane molasses. Most are branded products containing cane or beet molasses and other syrup products from the food and drink industry; full nutritional specifications are available from distributors. Products are available to suit a variety of requirements; crude protein level can range from 6% to 60%, some products are enhanced with minerals and trace elements, some with oil, some are specifically designed to suppress dust and all will help improve palatability.

There are numerous options for on-farm storage, e.g. 1000 litre containers, 3000 litre former orange juice containers, industrial tanks that can hold a full lorry load. Feeding can be as part of a home mixed ration or on its own through lick feeders. These feeds are ideal for dampening down dusty meals or encouraging intakes of less palatable forages.
Sugar Co-Products

**Molassed Sugar Beet Pulp**

Pellet, nut or shred

**Appearance**

High in energy, moderate in fibre. Well known rumen conditioner which aids the digestion of other feeds.

**Palatability**

Very Good

Forages

Whole Crop Silage (WSC) - Fermented and Urea Treated.

Yellow brown fibrous forage

### Nutritional Notes

Fermented WSC has a high DM content and balances well low DM/high protein legume silages. Urea treated whole crop however is high in protein (mainly ammonia) and its alkalinity makes it ideal to balance acidic silages. Barley, oats and wheat cereals are all used.

<table>
<thead>
<tr>

Feed Grade Urea
Small Prill

**Appearance**

A very concentrated source of non-protein nitrogen that can be used by ruminants to make microbial protein. It contains 46% nitrogen, which is equivalent to 287% crude protein. Must be mixed thoroughly into rest of the ration, as it is fatally toxic if ingested in more than very small quantities. Must be fed alongside readily available energy and introduced gradually into the diet. It is not suitable for animals under 3 months of age.

**Nutritional Notes**

<table>
<thead>
<tr>
<th>Palatability</th>
<th>Upper Inclusion Rate (DM)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Poor</td>
<td>1%</td>
</tr>
</tbody>
</table>

**Storage/Processing**

Store bags in dry conditions. Must be mixed with other feeds. Water soluble and can be stored as a liquor. Can be used as a preservative for moist grain, straw and wholecrop.

</tbody>
</table>

**Fats and Oils**

Concentrated sources of energy, containing three times as much energy as cereals. They are used to help increase weight gain in finishing cattle or reduce weight loss and aid fertility in lactating cows. Processing into prills reduces the free oil in the rumen but more effective methods of rumen protection are available e.g. Calcium or Magnesium soaps made from palm oil.

**Vitamins & Minerals** *(Specialist guidance should be sought for specific recommendations)*

- Major Minerals (%) - Calcium (Ca), Phosphorous (P), Magnesium (Mg) and Sodium (Na).
- Minor Minerals (mg/kg or ppm) - Copper (Cu), Selenium (Se), Iodine (I), Manganese (Mn), Zinc (Zn) and Cobalt (Co).
- Vitamins - A, D₃, E (IU/kg), Vitamin B₁₂ (mg/kg).

Sometimes other B vitamins are included in supplements, particularly for young calves, and listed by name e.g. Thiamine (B₁), Riboflavin (B₂), Niacin (B₃), Pantothenic Acid (B₃), Biotin (B₉), Folic Acid (B₉).

**Direct Fed Microbials**

Also called probiotics and include yeasts and lactic acid bacteria. They may help rumen microbes break down fibre and raise rumen pH alleviating acidosis.
